

Speed

Definition: Speed is the distance traveled per unit time

#PhysicsDefinitions

speed: scalar quantity: cannot be negative

Average speed $\Rightarrow$ assumes that speed is the same throughout entire distance.

- reality: speed not same throughout distance traveled
- Speed at 1 instant $\Rightarrow$ may be diff from speed at another distant
- Speed of a particular object at a particular instant is known as instantaneous speed.

Formulas:

$$Speed = \frac{distance}{time}$$

$$Averagespeed = \frac{total\ distance\ covered}{total\ time}$$

#physicsFormulae

Uniform speed:

- if change in distance traveled by an object for every unit of time is the same $\Rightarrow$ object undergoes constant/uniform speed
-
